CELLUSENSE

We are inspired
by *nature*.

Hedera helix, which is included in the group of saponin-producing plants from the Araliaceae family, has many effects, such as antispasmodic, skin tonic, cytotoxic, reducing edema and vascular occlusion, reducing the inflammatory process of wounds, and regulating and strengthening the skin barrier.

Botanical Power,
Visible Beauty.

Ruscus aculeatus, is widely used for venous circulation disorders because of its venous vasoconstrictor properties, strengthening blood vessels and anti-edema effect, especially in leg care.

Camelia sinensis contains an abundance of bioactive compounds and is important for antioxidant activity, anti-aging and anti-cellulite (weight loss) properties, photoprotective properties, improving skin condition, and skin microcirculation.

Equisetum arvense stands out in the cosmetic field with its anti-aging, skin-firming, moisturizing, and mineral support thanks to its flavonoids and silica content.

Phenolic compounds such as p-hydroxybenzoic, caffeic, chlorogenic, and p-coumaric acids in *Symphytum officinale* (comfrey) root extract provide collagen enhancement and soothing power on human skin fibroblasts, while bioactive components such as allantoin are involved in processes such as cell renewal and tissue repair.

Most *Achillea* species show pharmacological activities such as antioxidant, anti-inflammatory, wound healing, microcirculation enhancer, and free radical scavenger. The presence of monoterpene 1,8-cineole, a well-known terpenoid oxide, in *Achillea millefolium* (Civanperçemi) species indicates that the plant has natural antioxidant and potent biological activity.

For skin: 1-5% (cream, tonic & serum)
